Save Point

Store listing and submission

QuillFin · Prepared for Logan Young, Save Point Limited · 6 November 2026

What Google Play and the App Store ask for, with QuillFin's answers. Account setup (Clerk, Convex, Stripe) is in `setup_guide.md`.

Before you start

- **D-U-N-S number** for Save Point Limited (free from Dun & Bradstreet; takes a few days). Both stores need it for an organisation account, and an organisation Play account skips the 12-tester closed test that new personal accounts must run.
- **Google Play Console** (one-off US$25) and **Apple Developer Program** (US$99 a year), both as Save Point Limited.
- **Production Clerk, Convex and Stripe** set up and `config/prod.json` filled in (`setup_guide.md` §6 and Production). Store builds without it only offer "Continue on this device".

Listing

- **Name**: QuillFin
- **Subtitle** (Apple, max 30): Notes that quiz you back
- **Short description** (Play, max 80): Notes, AI quizzes and practice problems, scheduled so you never forget.
- **Category**: Education

- **Keywords** (Apple, max 100): notes,flashcards,spaced repetition,quiz,study,revision,exam,FSRS,AI,practice problems (no other apps' names: Apple rejects trademarks in keywords)
- **Full description**:

> QuillFin turns your notes into quizzes and brings each question back right before you'd forget it.
>
> • Notes in folders. Type them, or import .txt, .md, .pdf, .docx and .pptx files. • AI quiz questions written from your own notes, short answer or multiple choice. • FSRS spaced repetition, the modern scheduling algorithm used by leading flashcard apps, for every question and practice problem. • A problem tracker for coding and maths practice: difficulty, tags, timed attempts and a re-solve schedule. • Today dashboard and an optional daily study reminder. • Works offline. Sign in to sync between your phone, tablet, computer and the web, or keep everything on this device with no account at all. • Bring your own OpenAI-compatible or Anthropic key for unlimited generation, or use QuillFin's AI within your plan. • Light and dark themes, built for phones, tablets and desktops.
>
> Made in New Zealand by Save Point.

- **Graphics** (`node tool/build_icons.mjs` makes them from the brand SVG):
  - Play icon 512×512: `store/play-icon-512.png`
  - Play feature graphic 1024×500: `store/play-feature-graphic.png`
  - The app icons themselves are generated into each platform folder.
- **Screenshots** (take them from a real build with sample notes):
  - Play: at least 2 phone shots; 7-inch and 10-inch tablet shots to be listed for tablets.
  - Apple: 6.9-inch iPhone (1320×2868), and 13-inch iPad (2064×2752) because the app runs on iPad.

Audience and ratings

- **Target age**: 13 and over (Play: tick 13–15, 16–17 and 18+ only). This keeps QuillFin out of Play's Families programme and matches the terms.
- **Content rating** (Play IARC, Apple age rating): an education/reference app with no violence, sexual content, gambling, drugs or profanity, and no chat or sharing between users (notes are private). No in-app purchases in the store builds (see Billing). Answer yes to anything asking whether the app generates content with AI.
- **Ads**: none.

Play Data safety

Collection is **optional** (the app works without an account). Everything is **encrypted in transit**, and users can **request deletion** (in the app, and at the delete account URL above). No data is **shared**: Clerk,

Convex, Stripe and Anthropic process it on Save Point's behalf, and sending notes to your own AI provider is something the user asks for.

Data type	Collected	Purpose
Personal info: Name, Email address	Yes	Account management, App functionality
App activity: Other user-generated content (notes, questions, problems)	Yes	App functionality
App activity: Other actions (review and attempt history)	Yes	App functionality
Financial info: Purchase history (plan status)	Yes	App functionality
Location, contacts, photos, device IDs, crash logs, analytics	No	

Apple App Privacy

Tracking: **No**. Data linked to the user, all for **App Functionality** only: Contact Info (name, email address), User Content (other user content), Identifiers (user ID), Purchases (purchase history).

`ios/Runner/Info.plist` sets `ITSAppUsesNonExemptEncryption` to false (HTTPS only), so uploads skip the export compliance question.

Billing

Store builds (iOS and Android) show the plan but never offer to buy or manage it, and don't point to the website for it (`PlanPanel`, `storeBuild`). Pro is bought on the web or desktop app through Stripe.

- **Google Play** allows this: the app only uses a subscription bought elsewhere.
- **Apple** (guideline 3.1.3(b), multiplatform services) only allows a subscription bought elsewhere to unlock features in the app if it can **also be bought with In-App Purchase** in the app. Expect App Review to ask for IAP.

Decided 2026-11-06: QuillFin launches on Android, the web and desktop first. The App Store release waits, and before it ships Pro is added as an In-App Purchase (StoreKit, with the App Store's server notifications feeding the `subscriptions` table the same way Stripe's webhook does).

App Review notes

Signing in is optional: reviewers can tap **Continue on this device**. To check sync and account deletion, give App Review a test account (a Clerk user made for them), and say that **Account > Delete account** permanently deletes the account.

Signing and building

Android. Make the upload key once and keep it, with its passwords, in the password manager and an offline backup. Losing it means a Play support request to reset it.

```
keytool -genkey -v -keystore ~/quillfin-upload.jks -keyalg RSA -keysize 2048 -validity 10000
-alias upload
```

Then create `android/key.properties` (git-ignored):

```
storePassword=...
keyPassword=...
keyAlias=upload
storeFile=/home/<you>/quillfin-upload.jks
```

Enrol in Play App Signing when creating the app (Google holds the app signing key; this is your upload key). Build:

```
flutter build appbundle --release --dart-define-from-file=config/prod.json
# build/app/outputs/bundle/release/app-release.aab
```

iOS (on a Mac with Xcode): open `ios/Runner.xcworkspace`, choose the Save Point team under Signing & Capabilities, then:

```
flutter build ipa --release --dart-define-from-file=config/prod.json
```

and upload `build/ios/ipa/*.ipa` with Transporter.

Versions. Every upload needs a higher build number: bump `version` in `pubspec.yaml` (`0.1.0+1` → `0.1.0+2`, and the first number for releases users see).

Status (6 November 2026)

Done: account deletion in the app, the web app and the backend; terms, privacy, cookie and account deletion pages; app icons on every platform and the Play graphics; release signing; store builds without purchases; `ITSAppUsesNonExemptEncryption`.

Open: the D-U-N-S number, the Play Console account, production Clerk/Convex/Stripe, the Play upload key and screenshots. Later, for the App Store: the Apple Developer account, Pro as an In-App Purchase, and a first build on a Mac (no Mac has built the iOS app yet).
